

CAN HACKERS GET INTO MY NETWORK THROUGH THE VENDING MACHINE?

Recently there have been many articles about security breaches happening through connected devices like thermostats and security cameras. Unlike these devices which are connected to your internal network, **your vending machine does not use your network and cannot be used to get into your network.**

HACKER PROOF

Your vending machine does not interact with your network, WiFi, Ethernet, etc. It has a virtual private network on top of the cellular network. It communicates only through the cell towers. Even if hackers got into this private network (unlikely) they would not have access into your office.
